

Figure S1. MSP-FITC binding to wild-type and *ptp-2* mutant proximal gonads. MSP-FITC binding to wild-type and *ptp-2* mutant gonads (shown) can be out-competed with a 25-fold molar excess of unlabelled MSP. Binding assays were conducted as previously described (Miller et al., 2003; Tsuda et al., 2008). Gonad orientation is with spermatheca to the right.
